The Internet of Trees

Árbol IoT in a Nutshell

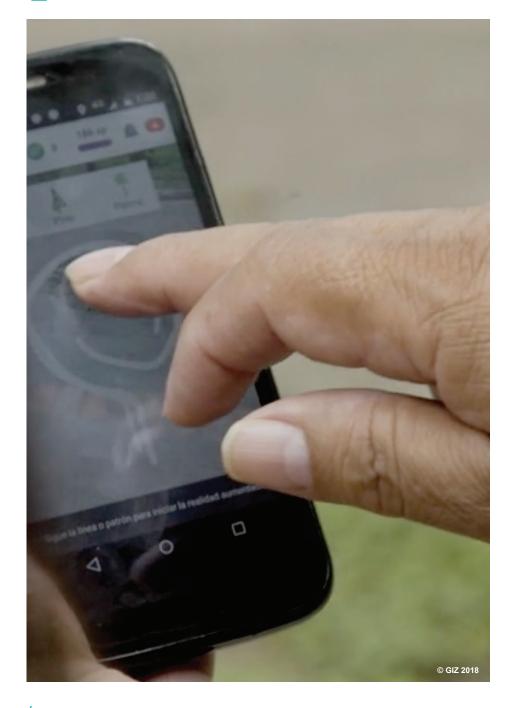

Árbol IoT or Internet de los Árboles (IoTrees or the Internet of Trees in English) is a platform to engage citizens in urban tree mapping and environmental monitoring. Designed and implemented in the City of Guadalajara, Mexico, it aims to empower citizen advocacy and support municipal urban tree management to improve the greenery in the city. Thus, contributing to ameliorate high temperatures and buffer the impacts of flood events. The platform seeks to crowdsource an easy-to-update urban tree inventory, visualize and quantify the eco-benefits of trees and assist in public decision-making based on data and evidence.

Árbol IoT is a cross-platform composed of a mobile and web app, and a network of low-cost sensors that allows citizens to monitor the pollutants suspended in the environment, weather and noise on a street scale. The

platform encourages engagement with green gamification and enables participation of a wide range of the population, including the elderly. It fosters inclusion through a mobile interactive table that can be placed in public spaces and used by citizens who don't have access to digital technology. Lite versions of the mobile app allow citizens with limited or no mobile data connection on their devices to map and capture information offline and, later, upload it when WiFi connection is available.

Árbol IoT as part of the "ICTbased Adaptation to Climate Change in Cities" Global Program

Árbol IoT was conceived in the framework of activities of the Global Program "ICT-based Adaptation to Climate Change in Cities (ICT-A)". The program's goal is to ideate, implement and upscale digital solutions to support selected cities in Peru, Mexico and India become more resilient. Following the program's strategic principles (see p. 9-10) the digital solutions contribute to achieving Climate Digital Cities.

ICT-A is implemented by the

Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) GmbH on behalf of the German Federal Ministry for Environment, Nature Conservation and Nuclear Safety (BMU) as part of their International Climate Initiative (IKI).

The Climate Digital Cities Hub

The Climate Digital Cities Hub is an online platform designed to showcase digital solutions that tackle climate change in cities. Here, further information and downloads about Árbol IoT and other digital solutions can be found: https://www.climate-digital-cities.com

Árbol IoT & the SDGs

Árbol IoT contributes to the following Sustainable Development Goals (SDGs):

Árbol loT & Mexico's NDCs

Árbol IoT is contributing to the following goals of Mexico's Nationally Determined Contributions (NDCs) in the Adaptation Area (Adaptation to climate change for the social sector):

- Point 1.ii: Ensure capacity building and participation of the society, local communities, indigenous peoples, women, men, youth, civil organizations and private sector in national and subnational climate change planning.
- Point 1.iii: Reduce the population's vulnerability and increase its adaptive capacity through early warning systems, risk management, as well as hydrometeorological monitoring, at every level of government.
- Point 1.iv: Strengthen the adaptive capacity of the population through transparent and inclusive mechanisms of social participation, designed with a gender and human rights approach.

Point 1.viii: Reducing at least by 50% the number of municipalities in the category of "most vulnerable"

Overall. Árbol IoT contributes to the NDCs call for multi-level governance by offering an adaptive solution at the city level, with the option of upscaling it to additional municipalities. Moreover, it helps to fulfil the identified needs of capacity-building, knowledge exchange and innovation in the context of adaptation measures in the section "Capacity Building, Transfer of Technology and Finance for Adaptation". Specifically, the digital solution directly supports the identified need of "methods and tools to assess climate impacts, vulnerability and adaptation in specific sectors and regions".

¹Government of Mexico (2016) <u>Intended Nationally</u> Determined Contribution

Strategic Principles for "Climate Digital Cities"

FOSTER CITIZEN ENGAGEMENT

- Carrying out the program for and with citizens;
- Supporting participation of vulnerable groups:
- Allowing a wider range of experiences and knowledge to jointly find solutions to harness collective wisdom.

TACKLE LOCAL CLIMATE CHALLENGES

- Focusing on challenges identified by the citizens and that have been shown in climate scenarios, vulnerability assessments, etc.;
- Collecting and collating data and information to develop measures for climate adaptation;
- Providing inputs to guide resilience in urban infrastructure.

CONTRIBUTE TO THE CITY'S PLANNING PROCESS

- Aligning activities to current urban planning processes;
- Identifying missing data needed to increase urban resilience:
- Anchoring collected data to current open data efforts and existing information systems.

PROMOTE LOCAL CO-CREATION

- Drawing upon local innovation ecosystems;
- Supporting involvement and further development of local talent;
- Enabling social appropriation of the jointly developed measures.

PLAN & IMPLEMENT FOR SUSTAINABILITY

- Contribute to the long-term vision of the city, setting short-term actions:
- Involving a wide range of stakeholders and communicating in an easy to understand manner:
- Aligning local, regional and national strategies.

FACILITATE TRANSFERABILITY & UPSCALING

- Managing knowledge, documenting innovative approaches and good practices in a precise manner;
- Feeding back lessons learned and success factors to improve the process:
- Spreading the knowledge, i.e. tools, results, etc.

the Noun Project

MAKE A RESPONSIBLE USE OF DATA

- Complying with international standards as well as national and local norms and regulations;
- Addressing and mitigating risks to data protection and cyber security;
- Strengthening the citizens digital competenc ies to recognize risks and threads, and protect themselves better.

the Noun Project

PRIORITIZE OPEN SOURCE

- Trying to reduce software and license dependencies for local governments and other stakeholders;
- Fostering collaboration with the local ecosystem and across sectors:
- Customizing existing open source solutions.

Ideating, Implementing & Upscaling Árbol IoT in Mexico

PHASE 1

Ideation & Implementation (Municipal Level)

In each partner country, the Gobal Program ICT-A is carried

out in two phases: (1) ideation and implemention, and (2)

political partner is the Ministry for Environment and Natural Resources (SEMARNAT in Spanish) through its General Direction of Climate Change Policies. The development partners for each phase are the following:

upscale. In Mexico, the program's

- Timeframe: 10/2017 09/2018
- Partner: Municipality of Guadalajara
- Operative direction: Direction of Government Innovation

PHASE 2

Upscale (Metropolitan Level)

• Timeframe: 10/2018 - 12/2019

- Partner: Metropolitan Planning Institute of Guadalajara (IMEPLAN in Spanish)
- Operative direction: Direction of Sustainability and ICT

(Municipal Level)

- **Timeframe:** 10/2018 12/2019
- Partner: Municipality of Zapopan
- Operative direction:
 Directions of Environment and Economic Development

KEY RESULTS (PHASE 1)

- > 2-month testing period
- > 5-day public mappathon
- > 5 installed sensor-prototypes
- > 477 app downloads
- > 11 272 notifications
- > 3 295 validated trees
- > 389 new captured trees

"Árbol IoT seeks to improve urban tree management and advocacy efforts to ameliorate high temperatures and buffer the impacts of flood events in Guadalajara"

04

Fighting Climate Change with Urban Trees

Throughout an innovative cocreation process, the Municipality of Guadalajara identified the need to improve the state, quality and quantity of their urban trees as a measure to adapt the city to the impacts of two major climate challenges: (1) increasing temperatures and (2) extreme weather events. Also, the need to allocate more resources to improve urban trees was recognized by the citizens as priority in the participatory budgeting of 2017. Many trees have been planted in public areas by the municipality, as well as by citizens. To efficiently plan and manage them towards improving their state and quantity, public officers need an overview of all the trees in the city and their current situation. Thus, the municipality needs to develop an easy-to-update urban tree inventory.

EXTREME WEATHER EVENTS

Mature trees regulate water flow, preventing floods and reducing the risk of natural disasters.

INCREASING TEMPERATURES

Urban trees can cool the air between 2 and 8 degrees Celsius.

Urban trees are priority for Guadalajara's citizens (participatory budgeting 2017).

A Citizen-Centered Design Approach

Digitally enhanced public services and citizen science hold great potential to increase climate resilience in cities, providing platforms for inclusion and improving the dialog between city administrations and citizens. Yet, tendencies to prioritize technology ahead of citizen's perspectives jeopardize their sustainability and scalability.

Árbol IoT was conceived putting citizens – not technology – at the core of its design. The platform is the result of an innovative co-creation process carried out under a citizen-centered design approach. It was the first time the City of Guadalajara developed a public service under such an approach. The co-creation process carried out included Design Thinking Sprints - a multistakeholder method to develop digital solutions, meeting the city's and citizen's needs and desires, in a technologically feasible and iterative problem-solving manner.

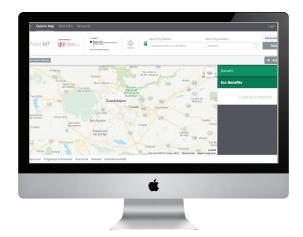

The co-creation process fostered cross-sector collaboration among several city departments. It brought together representatives from different areas including those of environment, urban planning, citizen participation, government innovation, etc., as well as universities, research institutes, private companies, startups, activists, NGOs and citizen associations.

"Árbol IoT was conceived putting citizens – not technology – at the core of its design! The platform is the result of an innovative co-creation process with the goal of meeting the city's and citizen's needs and desires, in a technologically feasible and iterative problem solving manner"

Árbol IoT's Cross-Platform

MOBILE APP

A mobile app for Android and iOS to crowdsource data about urban trees, inter alia using Augmented Reality (AR) and GPS. Information about trees can be easily validated by experts and certified arborists with a specific user permission. "Lite" versions that can be used with minimal or no mobile data are also available to ensure citizen inclusion.

WEB APP & BACK-END PLATFORM

A web dashboard for citizens to access all the data and information collected with the app and low-cost sensors. Users can download the data and make basic data analytics such as the amount of carbon captured by trees.

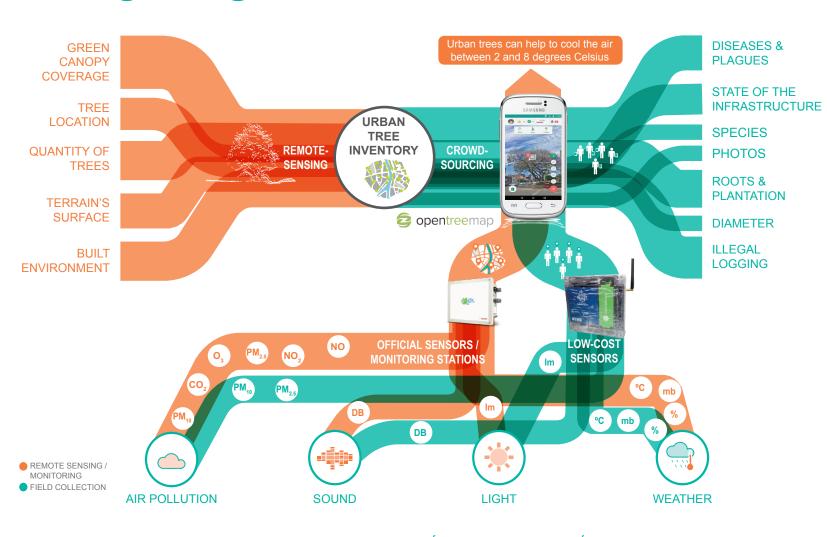

https://arbolesmapa.guadalajara.gob.mx/

A back-end platform for internal use and management by the city. This web administrator is based on no-code accessibility allowing the municipally staff to make any update through the cross-platform (ex. push notifications, user management, content update, etc.)

ENVIRONMENTAL SENSOR

A prototyped low-cost sensor with a microcontroller compatible Arduino Pro Mini that helps citizens to monitor temperature, humidity, fine particles PM 2.5 and PM 10, as well as Nitrogen Oxide (NOx). The device contains an internal rechargeable battery (LiPo) through USB or solar feed. The devices are interconnected through a NBIoT (Narrow Band IoT) network. Data can be visualized through the web/mobile app. It can also be piped to any other source.

Integrating Árbol IoT Data into the Cities' Platforms

The urban tree inventory is based on an existing tree database developed from a 3D scanning of the city with LiDAR (Light Detection Ranging) technology, which made it possible to identify the number and location of trees. To have a more accurate inventory, this database needs to be complemented with tree data from the ground, such as trunk diameter, species, plagues and diseases, etc. Awarenessraising about the eco-benefits of trees is achieved by visualizing crossed data from urban trees with the sensors' real-time data about environmental conditions (air quality, noise, light and temperature).

"Árbol IoT mobilizes citizens to provide information about trees in the field to complement remotesensing data."

Digital Citizen Engagement & Inclusion

GREEN GAMIFICATION

Árbol IoT uses gamification to encourage engagement. Citizens are motivated to use the platform and provide data through green point scoring. The green points can be earned by providing information about urban trees and environmental measures. Later on, the points can be exchanged for virtual awards in the form of local landmarks such as a virtual tequila bottle or a virtual cathedral building. In the future, these virtual awards will have the possibility to be exchanged for public services (e.g. parking time or discounts on property tax).

APP "LITE" VERSIONS

For citizens who have access to smartphones but have very limited or no mobile data connection, a lite version of the mobile App is available. This lite version allows users to map and capture information offline and, later on, upload it when WiFi connection is available.

PUBLIC INTERACTIVE TABLE

To "leave no one behind", Árbol IoT envisions means to allow participation of citizens who don't have access or don't know how to use a smartphone or tablet. Thus, Árbol IoT will prototype a mobile public interactive table that can be placed in public spaces.

"Árbol IoT *leaves* no one behind, enabling participation of citizens with limited or no access to smartphones or tablets".

International Transfer

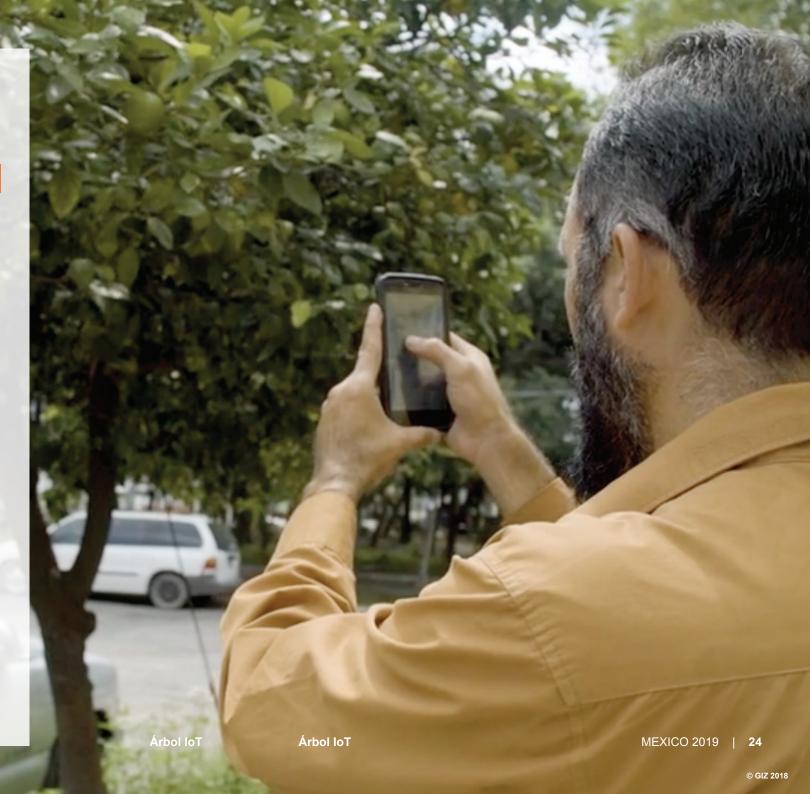

I want Árbol IoT in my city! How can I transfer it?

As an open source technology, Árbol IoT is fully replicable! We are currently working on an interactive documentation package to transfer and upscale the platform to other international cities. The idea is to make the platform available using web-based hosting services. Interested cities can easily transfer and customize the platform to their specific needs, capacities and IT requirements. So, if you are thinking about developing something similar in your city, this is an option that can be easily transferred and tailored to fit your needs!
